Exp no: 8 NMAP to Discover live Hosts Using
6/8/24 Nmap Scans on the TryHackMe Platform

AIM:

To study the Working of the Nmap tool and discover live hosts in a network using different host discovery techniques such as ARP scanning, ICMP scanning, TCP scanning and UDP scanning on the TryHackMe platform.

STEPS:

1. Open the TryHackMe Platform and select the Nmap room
2. Study the network topology and identify the source and destination hosts
3. Use ARP requests to discover the MAC address of devices available in the local Network
4. Observe how ARP packets are broadcast within the network and identify the devices that
5. Use the ICMP protocol to send ping requests between two system and observe the responses
6. Analysis the packet flow and identify the exchange of ARP packets before ICMP communication
7. Perform ARP host discovery using the Nmap command and identify all active hosts in the local network.
8. Perform ICMP echo scanning and observe the hosts that respond to the scan

Exp no: 10

INTERNETWORKING WITH ROUTING IN CISCO PACKET TRACER SIMULATOR

A) Design and configure a simple Internetwork Router in cisco packet Tracer:

AIM:

To design and configure two different network using a router and switches, assign static IP addres and verify packet communication between the networks.

STEPS:

1. Open cisco packet tracer
2. Add 1 router, 2 switches and 3-4 pcs
3. Connect PCs to switches using Copper straight through Cables
4. Connect both switches to the router
5. Assign Static IP addresses to all PCs
6. Configure the router interfaces with suitable IP address
7. Enable the router interface using no shutdown
8. Set the router interface IP as the default gateway for each network
9. Use the Ping command to check connectivity
10. Select simulation mode and observe the packet transmission path through the router

RESULT:

The two network were successfully connected using a router, and communication between different networks was verified successfully using the ping command
